- FUNCTION: MAJOR STRUCTURAL PROTEIN OF TISSUES SUCH AS AORTA AND
- FUNCTION: MAJOR STRUCTURAL PROTEIN OF TISSUES SUCH AS AORTA AND
- SUNCTION: WHICH MUST EXPAND RAPIDLY AND RECOVER COMPLETELY.
- SUBUNIT: THE POLYMERIC ELASTIN CHAINS ARE CROSS-LINKED TOGETHER
INTO AN EXTENSIBLE 3D NETWORK.
- SUBCELLUIAR LOCATION: EXTRACELLULAR MATRIX OF ELASTIC FIBERS.
- PTM: THE CROSSLINKS ARE MADE OF DEAMINATED LYS.

cells or other biological samples (such as non-recombinantly

proteins by hydrolysing many of the macromolecules while leaving

the structural proteins intect. In the case of silk proteins, the

proteins by hydrolysing many of the macromolecules while leaving

the structural proteins intect. In the case of silk proteins, the

crowding lysate is further purified by ion-exchange or affinity

choming. In the present case, the pQE((SP1)4/(SP2)1)4 gene

was cloned into vector pQE-9 for recombinant expression in

Escherichia coil, and recombinant silk protein was obtained in 97%

purity using propionic acid and anion-exchange chromatography on

QAE-Sephadex A50. Products obtained using the methods of the

including films, fibres, woven articles, sutures, ballistic

protection, parachutes and parachute cords. The new method has

the following advantages over prior art: it involves fewer steps,

requires less time and smaller volumes of reagants, results in

better recovery of protein at higher purity (70-99%), is easy to

scale up, and the fibres are spun in an environmentally benign

combined to the contraction and cost.
Recovering structural polypeptides in a biological sample, useful for purifying and spinning spider silks and other structural proteins, comprises treating the sample containing the polypeptides with an acid

The present sequence is that of orb-weaver spider (Nephila clavipes)
recombinant silk protein pET((SP1)4/(SP2)1)4. The invention
provides methods for purifying and spinning spider silks and other
structural proteins. Organic acids are used to lyse recombinant
cells or other biological samples (such as non-recombinantly
derived cells), and enrich the purity and yields of structural
proteins by hydrolysing many of the macromolecules while leaving
the structural proteins intect. In the case of silk proteins, the
resulting lysate is further purified by ion-exchange or affinity
chomicoraphy and processed into an aqueous-based mixture for
fibre spinning. In the present case, the pET((SP1)4/(SP2)1)4 gene
was cloned into vector pET34 for recombinant expression in
Scherichla coli, and recombinant silk protein was obtained in
75-75% purity using propionic acid and anion-exchange chromatography
on QAE-Sephadex A50. When denaturant (3 M quanidine-HCI) was added
to the propionic acid, the recombinant protein was obtained in 80%
purity. Products obtained using the methods of the invention can
be used in the construction of many materials included.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Recovering structural polypeptides in a biological sample, useful for purifying and spinning spider silks and other structural proteins, comprises treating the sample containing the polypeptides with an acid
be used in the construction of many materials including films, fibres, woven articles, sutures, ballistic protection, parachutes and parachute cords. The new method has the following advantages
                                                                                                                                                                                                                                                                                                                          Spider; orb-weaver; silk protein; pET((SP1)4/(SP2)1)4;

over prior art: it involves fewer steps, requires less time and smaller volumes of teagents, results in better recovery of protein at higher purity (70.99%), is easy to scale up, and the fibres are spun in an environmentally benign solution reducing hazardous waste

This invention describes a novel DNA sequence, encoding a synthetic spider silk protein. Comprising modules, each comprising a group of sequentially arranged oligonoucleotides, each oligonoucleotide encoding a repeating unit of a spidoroucleotide. Act of synthetic protein has at least 84% homology with the Nephila clavipes spidoron protein has at comprising and/or membranes, particularly: (1) for medical use, especially to close wounds and/or to support or cover artificial organs; (ii) as adhesion surfaces for culturing cells; and artificial organs; (ii) as adhesion surfaces for culturing cells; and cilis as filters. The synthetic proteins are very similar to native spider silk proteins; can be prepared on a large scale and can be spun to fibres with excellent mechanical properties (strength and elasticity). Compared they retain water solubility after long-term boiling in aqueous solutions and since they are also soluble in organic solvents but precipitated at high sait concentration, they are easily extracted and purified. The modular construction of the invention facilitates incorporation of additional peptide-encoding sequences, e.g. to simplify purification or modulate solubility. This sequence represents the synthetic N. clavipes spidroin-1 homologue SOISOI described in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 33;

This invention describes a novel DNA sequence, encoding a synthetic spider silk protein, comprising modules, each comprising a group of sequentially arranged oligonucleotides, each oligonucleotide encoding a repeating unit of a spidroin protein. The synthetic protein has at least 84% homology with the Nephila clavipes spidroin protein and is used to produce synthetic fibres, films and/or membranes, particularly: (1) for medical use, especially to close wounds and/or to support or cover artificial organs; (ii) as adhesion surfaces for culturing cells; and (iii) as filters. The synthetic proteins are very similar to native spider silk proteins; can be prepared on a large scale and can be spun to fibres with excellent mechanical properties (strength and elasticity). Can solve they retain water solubility after long-term boiling in aqueous colutions and since they are also soluble in organic solvents but precipitated at high sait concentration, they are easily extracted and purified. The modular construction of the invention facilitates in concentration in additional peptide-encoding sequences, e.g. to simplify purification or modulate solubility. This sequence represents the synthetic N. clavipes spidroin-1 homologue SOISOISOI described in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                33;

                                                                                                                                                        This invention describes a novel DNA sequence, encoding a synthetic sepider silk protein, comprising modules, each comprising a group of sequentially arranged oligonucleotides, each oligonucleotide encoding a repeating unit of a spidroin protein. The synthetic protein has at least 84% homology with the Nephila clavipes spidroin protein and is used to produce synthetic fibres, films and/or membranes, particularly: (1) for medical use, especially to close wounds and/or to support or cover artificial organs; (11) as adhesion surfaces for culturing cells; and (ii) as filters The synthetic proteins are very similar to native spider silk proteins; can be prepared on a large scale and can be spun to fibres with excellent mechanical properties (strength and elasticity).
                                                                                                                                                                                                                                                                                                                                                                                                            simplify
                                                                                                                                                                                                                                                                                                                                         Also they retain water solubility after long term bolling in aqueous solutions and since they are also soluble in organic solvents but precipitated at high salt concentration, they are easily extracted and purified. The modular construction of the invention facilitates incorporation of additional peptide-encoding sequences, e.g. to simplification or modulate solubility. This sequence represents the synthetic N. clavipes spidroin-1 homologue SOISMIZ described in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             295

The invention relates to a method of producing silk-like proteins (SLP) in a green plant by providing a green plant containing an SLP expression cassette. The green plant contains the expression cassette P-SLP-T where

P is a promoter for driving the expression of an SLP transgene and T is a 5' terminator. The method is useful for producing silks and silk-like proteins in green plants. The silks and silk-like proteins may be used in fabrics or in material construction, such as rope, surgical sutures, lexible tie downs for certain electrical components, or as a biomaterial for implantation. The method allows for more cost effective production of silk not obtained from natural or microbial sources. The present sequence is the silk protein Dragline protein (DP) I synthetic variant DPIB IGMET (1.e. 16 copies of DPIB) which is used as an SLP construct in the method of the invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention relates to a method of producing silk-like proteins (SLP) in a green plant by providing a green plant containing an SLP expression cassetter. The green plant contains the expression cassetter P-SLP-T where P is a promoter for driving the expression of an SLP transgene and T is a 5' terminator. The method is useful for producing silks and silk-like proteins in green plants. The silks and silk-like proteins may be used in fabrics or in material construction, such as rope, surgical sutures, flexible tie downs for certain electrical components, or as a biomaterial for implantation. The method allows for more cost effective production of silk not obtained from natural or microbial sources. The present sequence is the silk protein Dragline protein (DP) I synthetic variant DPLB/his tag 16mer (i.e. 16 copies of DPLB with a His stag at the C-terminus) which is used as an SLP construct in the method of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     36;

in a green plant by providing a green plant containing an Street Parts of cassette. The green plant contains the expression cassette P-SLP-T where P is a promoter for driving the expression of an SLP transgene and T is a 5' terminator. The method is useful for producing sliks and silk-like proteins in green plants. The silks and silk-like proteins in green plants. The silks and silk-like proteins may be used in flabrics or in material construction, such as rope, surgical sutures, flexible tie downs for certain electrical components, or as a blomaterial for implantation. The method allows for more cost effective
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Orb-weaving spider; silk-like protein; SLP; transgenic plant; prometer; 5' terminator; fabric production; material construction; rope; surgical suture; flexible tie down; electrical component; implantation; bragline protein 1; DP-1B Smer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to a method of producing silk-like proteins (SLP)

                                                                                                                                                                                                                                                                                                                                                                                                             à
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            à
                                                                                                                                                                                                                                                                                                                                                                                                                            in a green plant by providing a green plant containing an SLP expression cassette. The green plant contains the expression cassette P-SLP-T where P is a promoter for driving the expression of an SLP transgene and T is a 5' terminator. The method is useful for producing silks and silk like proteins in green plants. The silks and silk-like proteins may be used in flathics or in material construction, such as rope, surgical sutures, blomaterial for implantation. The method allows for more cost effective production of silk not obtained from natural or microbial sources. The present sequence is the silk protein Dragline protein (DP) is synthetic variant DPLB/his tag 8mer (i.e. 8 copies of DPLB with a His tag at the C-terminus) which is used as an SLP construct in the method of the

This invention describes a novel DNA sequence, encoding a synthetic spider silk protein, comprising modules, each comprising a group of sequentially arranged oligonucleotides, each oligonuclotide encoding a repeating unit of a spidroin protein. The synthetic protein has at least 84% homology with the Nephila clavipes spidroin protein and is used to produce synthetic fibres, films and/or membranes, particularly: (1) for medical use, especially to close wounds and/or support or cover artificial organs; (11) as adhesion surfaces for culturing cells; and artificial organs; (11) as adhesion surfaces for culturing cells; and cills as filters. The synthetic proteins are very similar to native spider silk proteins; can be prepared on a large scale and can be spun to fibres with excellent mechanical properties (strength and elasticity). Can be prepared on a large scale and can be spun to fibres with excellent mechanical properties (strength and elasticity). Can be prepared at high salt concentration, they are easily extracted and precipitated at high salt concentration, they are easily extracted and incorporation of additional peptide-encoding sequences, e.g. to simplify the synthetic N. clavibes spidroin-1 homologue SOI described in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 31;

This invention describes a novel DNA sequence, encoding a synthetic spider silk protein. Comprising modules, each comprising a group of sequentially arranged oilgonucleidies, each oilgonucleidie encoding a repeating unit of a spidroin protein. The synthetic protein has at least 84% homology with the Nephila clavipes spidroin protein and is used to produce synthetic fibres, films and/or membranes, particularly: (1) for medical use, especially to close wounds and/or to support or cover artificial organs; (ii) as adhesion surfaces for culturing cells; and (iii) as filters. The synthetic proteins are very similar to native spider silk proteins; can be prepared on a large scale and can be spun to fibres with excellent mechanical properties (strength and elasticity). Also they retain water solubility after long-term boiling in aqueous solutions and since they are also soluble in organic solvents but precipitated at high salt concentration, they are easily extracted and purified. The modular construction of the invention facilitates construction of additional peptide-encoding sequences, e.g. to simplify purification or modulate solubility. This sequence represents a construct composed of the Leba signal peptide-encoding sequence represents a construct composed of the Leba signal peptide-encoding sequence represents a construct composed of the Leba signal peptide. N. clavipes spidroin.1 synthetic homologue SOl, a c-Myc-tag and an endoplasmic reticulum (ER)-retention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         31;
                                                   encoding synthetic spider silk protein, useful e.g. for closing comprises modules that encode repeating units of spidroin
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   RGGLGGGGAAAAAAAAAAAGAGGGYGGCGSGGTSGPGGYGPGQQTSGRGGLGGGGGA 190

The protein improves the moisturizing/softening action of the compositions. The protein, and its fragments are used in cosmetic or dermatological compositions. These compositions have use as hair or skin care products; and make-up or sunscreens. As the protein is a good, persistent film-formers on the skin of low surface density, it can be used for delivery of active agents that are generally difficult to administer, e.g. vitamins, hormones, moisturizers or agents for treating disorders of the skin and hair.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       612 YGGLGSQGTSGRGGLGGQGAGAAAAAAAAAAGGAGQGGYGGLGSQGT--SGPGGYGPG 667

The invention relates to a method of producing silk-like proteins (SLP) in a green plant by providing a green plant containing an SLP expression cassette. The green plant contains the expression cassette P-SLP-T where P is a promoter for driving the expression of an SLP transgene and T is a proteins. The method is useful for producing silks and silk-like proteins in green plants. The silks and silk-like proteins may be used in fabrics or in material construction, such as rope, surgical sutures, blomaterial for implantation. The method allows for more cost effective production of silk not obtained from natural or microbial sources. The present sequence is orb-weaving spider spidoill, a natural silk protein whose sequence is used as the basis for the SLP proteins used in the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                              34;

Spider silk proteins, and peptide fragments within the proteins, can be produced and purified independently and can then be mixed and made into fibres that have higher tensile strengths and elasticity than naturally occurring fibres. The fibres can be used in mixed composites. The invention allows the two naturally occurring Nephila clavibes silk proteins to be produced independently so that they can later be combined to form silk fibres of high tensile strength
                                                                                                                                                                                                         dragline;

The invention provides isolated cDNA molecules coding for spider silk proteins. The spider silk proteins are characterized by repeating alpha and beta regions and optional variable regions. The DNA sequences are useful in the production of spider silk protein by recombinant DNA techniques. The recombinant spider silk proteins may be used for the production of fibers. The present sequence represents the spider silk protein 1, derived from the major ampullate gland of Nephila clavibes.
                                                                                                                                                                                                                                                                                                                   139

Patent No. 5728810
GENERAL INFORMATION:
APPLICANT: Lewis, Randolph V.
APPLICANT: ALWING
APPLICANT: ALMING
APPLICANT: Hinman, Michael B.
TITLE OF INVENTION: PROTEIN, A REPLICABLE VECTOR AND A TRANSFORMED CELL
TITLE OF INVENTION: CONTAINING THE ISOLATED DNA, AND PRODUCTS THEREOF
NUMBER OF SEQUENCES: 69
CORRESPONDENCE ADDRESS:
ADDRESSEE: Birch, Stewart, Kolasch & Birch
